ABSTRACT

PROBLEM TO BE SOLVED: To provide a system for allowing the **participant** of

electronic presentation or electronic **conference** to selectively **request** materials from a portable terminal by a simple operation, and to acquire the materials by a means such as an electronic mail or a mail.

SOLUTION: Each **participant** operates portable terminals 31-33 for **participants** in order to notify a PC 20 for a server of requested data during the progress of electronic presentation or electronic conference. The PC for a server selects the **data** specified from the time and position from a storage device, and **transmits** the **data** to the prescribed transmission destination.

METHOD AND SYSTEM FOR DISTRIBUTING INFORMATION AMONG GROUP **MEMBERS** BY USING SEMANTIC INFORMATION NETWORK, TRANSMITTING TERMINAL AND RECEIVING TERMINAL
                              ABSTRACT

PROBLEM TO BE SOLVED: To confirm a dynamic relative distance among group **members** without needing an intermediator and also to selectively **transmit** and receive **information** only to/from the opposite party conforming to a particular condition.

SOLUTION: When 'Masahiko' being a group **member** transmits a notification **request** event including his own **location** **information** to a semantic **information** network 10, the mobile terminal 31 of 'Shotaro' which has received the notification **request** event obtains a farness or nearness result value outside an **area** from its own **location** **information** and the **location** **information** of 'Masahiko' included in the notification **request** event . The mobile terminal 31 transmits the farness or nearness result value outside the **area** and its own **location** **information** as a notification **request** event response message to the mobile terminal 33 of 'Masahiko'. The mobile terminal 33 of 'Masahiko' obtains a farness or nearness evaluation value outside the **area** from the **location** **information** of 'Shotaro' included in the received notification **request**

event response message. The mobile terminal 33 displays the location of the opposite party based on...

                              ABSTRACT
PURPOSE: To provide various schedule support services to users by providing
a personal   **communication**   system with an individual **information**
 management means...

...the information management part of the individual information management
means of a user who has **registered** the **conference** outputs a **request**
to use a resource to a resource information management means 10. The
resource information management...

... the start of the conference to terminal numbers currently in use on the
basis of **position**   **information** in their **information** storage parts.
Then a **request** to connect the **conference** trunk number and terminal
numbers together is outputted to a connecting means 50.

Conference   call **service method in a mobile communication system,**
specially concerned in simultaneously performing a conference   call
between one originating subscriber **and a plurality of receiving**
subscribers **with one call attempt**

Abstract (Basic):
...   A **conference   call** service method in a mobile communication
   system is provided to simultaneously set up calls for N-number
   receiving **subscribers** in parallel, so that one originating
   subscriber can call with the N-number receiving **subscribers** with the
   same time that a call is attempted to one receiving **subscriber.**
...   station notifies an originating channel allocation completion to
   the exchange(403). The exchange requests receiving **location**
   information of N-number receiving numbers to an HLR(Home **Location**
   Register)(404). The HLR **transmits** location **information** of receiving
   mobile terminals to the exchange(405). The exchange requests receiving
   information of the...

...The receiving base station notifies the receiving channel allocation
   completion to the exchange(409). A **conference   call** is connected
   between the originating terminal and the receiving terminals(410).Image

  Method for providing and utilizing traffic information **by making use of**
   location   information **acquired by gps terminal, especially**
   constructing low cost and high efficiency intelligent transportation
   system

Abstract (Basic):
...   A method for providing and utilizing traffic **information** by
   making use of **location   information** acquired by a GPS terminal is
   provided to reduce cost required in constructing the prior ITS system
   and also to expand additional services **meeting** various **requests** of

customers.

...   According to the method for providing and utilizing traffic
information , a **subscriber** number list of a **position** check target
stored in an **information** storing server is checked in a positioning
server. **Subscriber information** of the **position** check target is
requested to an LBS(Location Based Service) server from the positioning
server. The LBS server informs the **position information** as to a GPS
terminal to the positioning server(S130). The **position information**
from the positioning server is stored in the information storing
server(S140). An **information** processing server processes the
subscriber position information and additional service
information (S150). And the information processing server converts the
processed **information** into a type to be **transferred** to the GPS
terminal.Image 1/1...

Abstract (Basic):
...   to quickly meet person with a desired condition at a desired
    place by transmitting a **meeting   request** to a terminal of an ideal
    type near an applicant when a mobile communication **subscriber
    requests** the **meeting** application.
...   A meeting information process server(160) receives a **meeting**
    application **request** from a WAP server(140), retrieves ideal types
    corresponding to ideal type information of a user from a **member**
    database(170), and extracts the retrieved ideal types. The meeting
    information process server(160) **transmits** ideal type **information**
    to a **position   information** process server(180). When the user shows
    ideal type **information** using a mobile **communication** terminal, the
    meeting **information** process server(160) converts ideal type
    information into a standard corresponding to a window size of the
    mobile **communication** terminal and transmits converted ideal type
    information to the WAP server(140). The **position   information**
    process server(180) grasps a current **position** of the ideal type
    transmitted from the meeting information process server(160) and
    transmits the grasped current **position** to the meeting **information**
    process server(160). In case that current **position** of the ideal type
    is requested from the user, the **position   information** process
    server(180) inquires whether **position   information** is opened to the
    ideal type...

...SPECIFICATION operations which may be requested by FU 120 include
  calculations required in evaluating Name Table **Entries** to provide
  logical **descriptors** to be loaded into **NC** 1926.
    Associated with both **FUDT** 1904 and EUDT 1966 are Dialect (D)
  registers 1905 and 1967. D registers 1905 and...

...upon integer and decimal operands, and upon mantissa fields of single
  and double precision floating **point** operands. Second ALU (EXP) 2016 is
  utilized to perform operations upon single and double precision floating
  point operand exponent fields in parallel with operations performed upon
  floating point mantissa fields by MULT...subtraction of those partial
  products.
    Finally, EU 122 performs normalization of the results of floating

point operand operations by left shifting of a final result's mantissa
field to eliminate zeros...ports MIO 10128 and MJP 10140 to IOS 10116 and
JP 10114 respectively. MEM 10112 **is** the primary path for **information
transfer** between External Devices 10124 (through IOS 10116) and JP
10114. MEM 10112 thus operates both...

...suitable for transfer into MEM 10112. IOS 10116 then indicates to MEM
10112 that new **information** is available for transfer into MEM 10112.
Upon acknowledgement by MEM 10112, this information is **transfer**red into
MEM 10112 through IOM Bus 10130 and MIO Port 10128. MEM 10112 stores the
information in selected portions of MEM 10112 physical address space. At
this time, IOS 10116 notifies...MEM 10112 by way of PA Bus 10146 and MJP
Port 10140. The instructions and **data** are **transferred** to FU 10120 and
EU 10122 by way of MJP Port 10140 and MOD Bus...

...is then transferred to ED 10124 through I/O Bus 10126.
    During execution of a **user** 's program, certain **information** required
by JP 10116 may not be available in **MEM** 10112. **In** such cases as
further described in a following discussion, JP 10114 may write a request
...frames of KOSMAS 10334;
        (2) an offset, relative to the Frame Header 10414, indicating the
location of the top of that Frame 10412;
        (3) **information** indicating the number of **passed** arguments
contained in that Frame 10412;
        (4) a dynamic back pointer, in UID/Offset format...

...SPECIFICATION of different S-Language Dialects.
    EUDT 1966 performs a similar function with respect to EU **122** . As will
be described **below** , EU 122 contains a **mC** , similar to mC 1912, which
is addressed through EUDT 1966 by SOPs specifying EU 122...format
compatible with ED 10124. IOS 10116 receives and stores this information,
and manipulates the **information** into formats suitable for **transfer**
into MEM 10112. IOS 10116 **then** indicates to MEM 10112 that new
information is available for **transfer** into MEM 10112. Upon
acknowledgement by MEM 10112, this information is transferred into MEM
10112...MEM 10112 by way of PA Bus 10146 and MJP Port 10140. The
instructions and **data** are **transferred** to FU 10120 and EU 10122 by way
of MJP Port 10140 and MOD Bus...

...the information to be written into MEM 10112 is placed on JPD Bus 10142
and **is** subsequently written into **MEM** 10112 at the **locations**
selected by the physical write address.
    FU 10120 places a semaphore signal on **IOJP** Bus 10132 to **signal** to
IOS 10116 that **information** , such as the results **of** executing **a**
user's program, is available to be read out of CS 10110. IOS 10116 may...
second procedure and pass an argument to the called procedure. The
calling procedure will also **pass** selected access **rights** to that
argument to the **called** procedure. The **passed** **access** rights exist
only for the duration of the call.
    In the dynamic access embodiment, access...through PRMUX 20720, Bus
20738, and MCNTL-FIU Bus 20164C.
    Returning to Fig. 207, MISSC **20726** is used in handling MC 20116

misses. In **the event** of a **request** referring to **data** not in MC 20116's cache, **MISSC** 20726 stores block address of the reference and type of operation to be performed, this **information** being provided from an address register in MC 20116 and from RM 20722. MISSC 20726...20244. A first 32 bit data output of OFFALUSA 20244 and a second 32 bit **data** output of OFFMUX 20240 are connected, **respectively** , to first and second **data inputs** of OFFALU 20242. A second 32 bit **data** output of OFFALUSA 20244 is connected to OFFSET Bus 20228. A first 32 bit **data** output of OFFALU 20242 is connected to JPD Bus 10142, to a first input of ...
